Eclypsium BE technical challenge - Sr Software engineer

Challenge Objective

Design and develop an API application to manage **assets** and their **components**, which may include vulnerabilities and threats identified through scanning processes (Note that we consider that the asset has a vulnerability or threat if the latest scan indicates that).

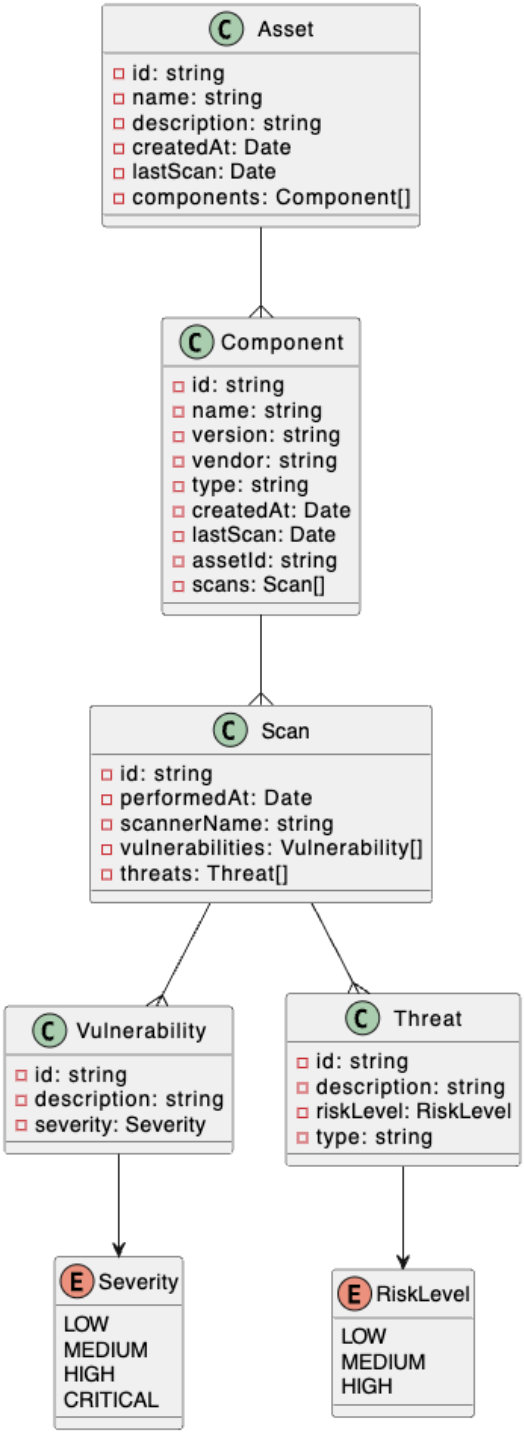
The solution must support the following features:

1. Asset Listing
    - Display registered assets with the ability to filter by relevant criteria.
2. Asset details
    - See the asset info with their components
3. List vulnerabilities by asset
4. List threats by asset
5. (Optional) Service to modify asset properties
6. (Optional) Service to remove an asset entirely

Expected Deliverables

- A functional solution that meets the requirements described above.
- Flexibility in implementation to allow deployment in an operational environment.
- Clear instructions for configuring, running, and testing the solution.

Suggested Model



Notes:

- Suggested languages: Go, Node, TS, and React, but you can pick any other language of your preference.

Evaluation Criteria

The evaluation will consider:

- The clarity and effectiveness of the proposed solution.
- The ability to manage and scale the described functionalities.
- The organization and presentation of the submitted work.
- The solution is not required to be complete; it will be evaluated based on the criteria for selecting and implementing a partial feature set, along with the quality of the delivered implementation.

Submission

Upload the complete project to a public or private repository that can be accessed for review. Include a document with clear instructions for evaluating the solution.

Good luck with the challenge! 🚀
